

# AI based stress and emergency detection using wearable sensor data

## 1.Problem Statement

Stress and medical emergencies often go undetected in real time, especially when a person is alone. Traditional monitoring systems require manual checking and cannot continuously track a person's physical condition. There is a need for an intelligent system that can automatically monitor wearable sensor data and detect abnormal health or activity patterns early.

## 2: Objective

To analyze wearable IoT sensor data and build a machine learning model that can identify human activities and potential stress or emergency conditions using physiological and motion sensor readings.

## 3.Data Collection

The system uses data collected from wearable sensors such as:

- >Accelerometer (a\_x, a\_y, a\_z)
- >Gyroscope (g\_x, g\_y, g\_z)
- >Temperature sensors
- >Heart rate / physiological signals

These sensors continuously record body movement and health parameters.

## 4.Data Cleaning

The collected data is preprocessed by:

- >Removing missing and duplicate values
  - >converting sensor values to numeric format
  - >Handling outliers and invalid readings
  - >Labeling activities such as sitting and walking
- This step ensures the data is accurate and reliable.

## 5: Data Exploration & Analysis (EDA)

Data visualization techniques are used to understand patterns:

- > Line plots for accelerometer and gyroscope data
  - >Histograms for temperature distribution
  - >Boxplots to detect outliers
  - >Correlation heatmaps to understand sensor relationships
- EDA helps identify trends and important features.

## 6.Data Modeling

Multiple machine learning models were trained, including:

- > Logistic Regression
- >K-Nearest Neighbors (KNN)
- >Decision Tree
- >Random Forest

Sensor features were used as input to classify activities and detect abnormal conditions.

## 7.Validation & Results

The trained models were evaluated using:

- >Training accuracy
- >Testing accuracy
- >Confusion matrix

The Random Forest model achieved the highest accuracy, showing reliable classification performance.

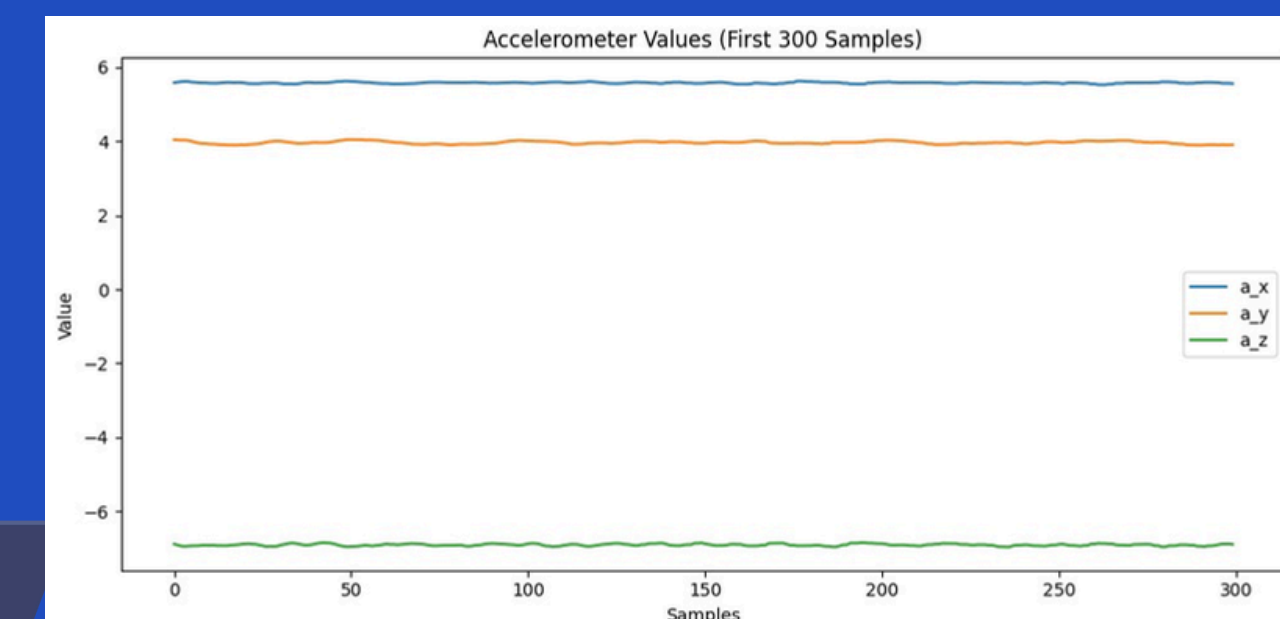

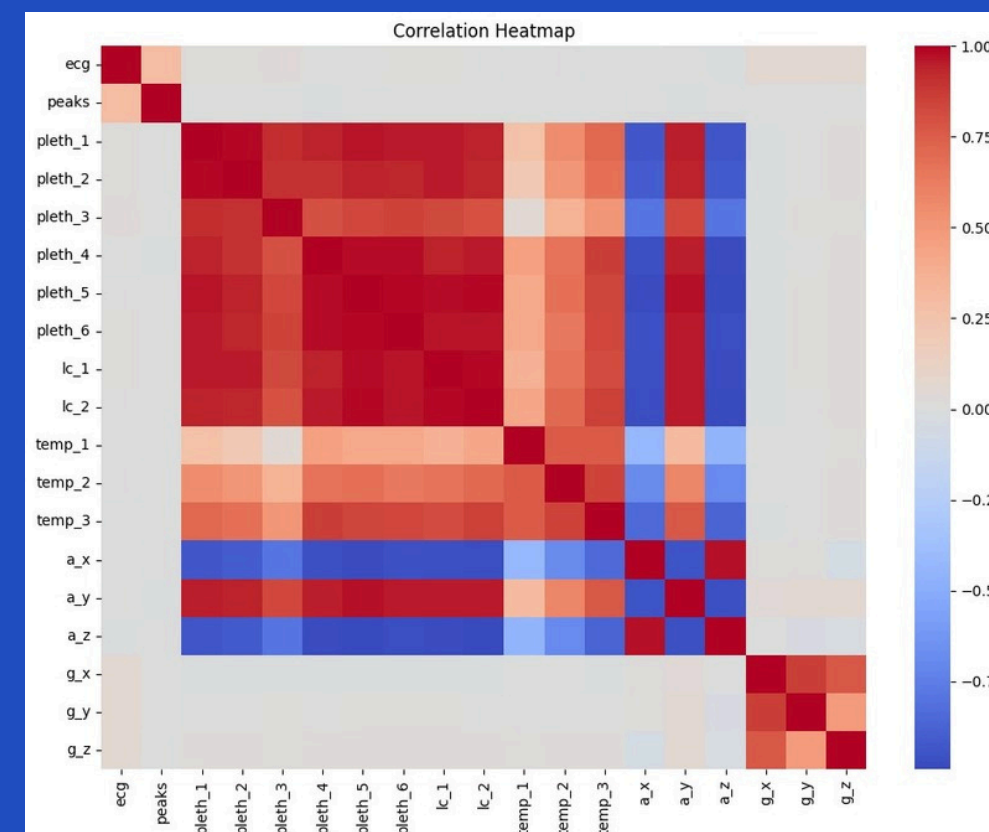

## 8: Conclusion & Applications

The proposed system successfully demonstrates how wearable sensor data and machine learning can be used for continuous health monitoring.

This approach can be applied in:

- >"Smart healthcare systems"
- >Stress monitoring
- >Emergency alert systems
- >Fitness and activity tracking
